Autonomous vehicles are driving today on some U.S. streets and are poised to grow rapidly in the years ahead. AVs could reduce traffic deaths, congestion, and emissions, while transforming local commerce and city transportation. But the regulations that govern them were written when this technology was science fiction. That makes these vehicles a case study in how regulation can best adapt to rapidly evolving technology, and the unique challenges of AI.

Matthew Lipka leads Federal Public Policy at Nuro. In this role, he guides the company’s initiatives around federal public policy, regulation, and government affairs. Nuro is a robotics company whose first product is a fully self-driving vehicle specifically designed for local goods transportation.
